## Sophos Firewall Security in the Campus

St. Berchmans College has implemented the Sophos Firewall network security device to prevent threats and malicious activities in its network. In order to monitor the activities and events generated by the firewall, the college has integrated the firewall with Netsurion, a network security monitoring solution.

**Security:** The integration of Netsurion with Sophos Firewall allows the college to monitor various security components such as firewall spam, virus, and IPS detection, suspicious email traffic, and advanced threat protection. This provides the college with increased visibility and alerts for any potential security threats, allowing them to take prompt action.

**Operations:** The integration also allows the college to monitor various firewall operations such as admin and sandbox activities, firewall allowed/denied traffic, system health, configuration changes, FTP activities, and WAF traffic. The real-time alerting capability of Netsurion enables the college to stay on top of any operational issues that may arise.

**Compliance:** The integration also enables the college to monitor various compliance components such as firewall logon success and failure, VPN login/logout, and logon failures. This helps the college to ensure that its network is in compliance with various regulations and standards.

The implementation of Sophos Firewall and integration with Netsurion at St. Berchmans College provides the college with increased security, performance, availability, and reliability of its network. The real-time monitoring and alerting capabilities of Netsurion allow the college to promptly identify and resolve any potential issues, ensuring the smooth functioning of its network.
